

Project Map Manager

A visual guide for everyday map updates

Update project details, photos and country maps without editing JavaScript.

The normal workflow

1	2	3	4	5
Open	Choose	Update	Check	Apply
Run the launcher	Pick a country	Edit or import	Photos · map · issues	Review then save

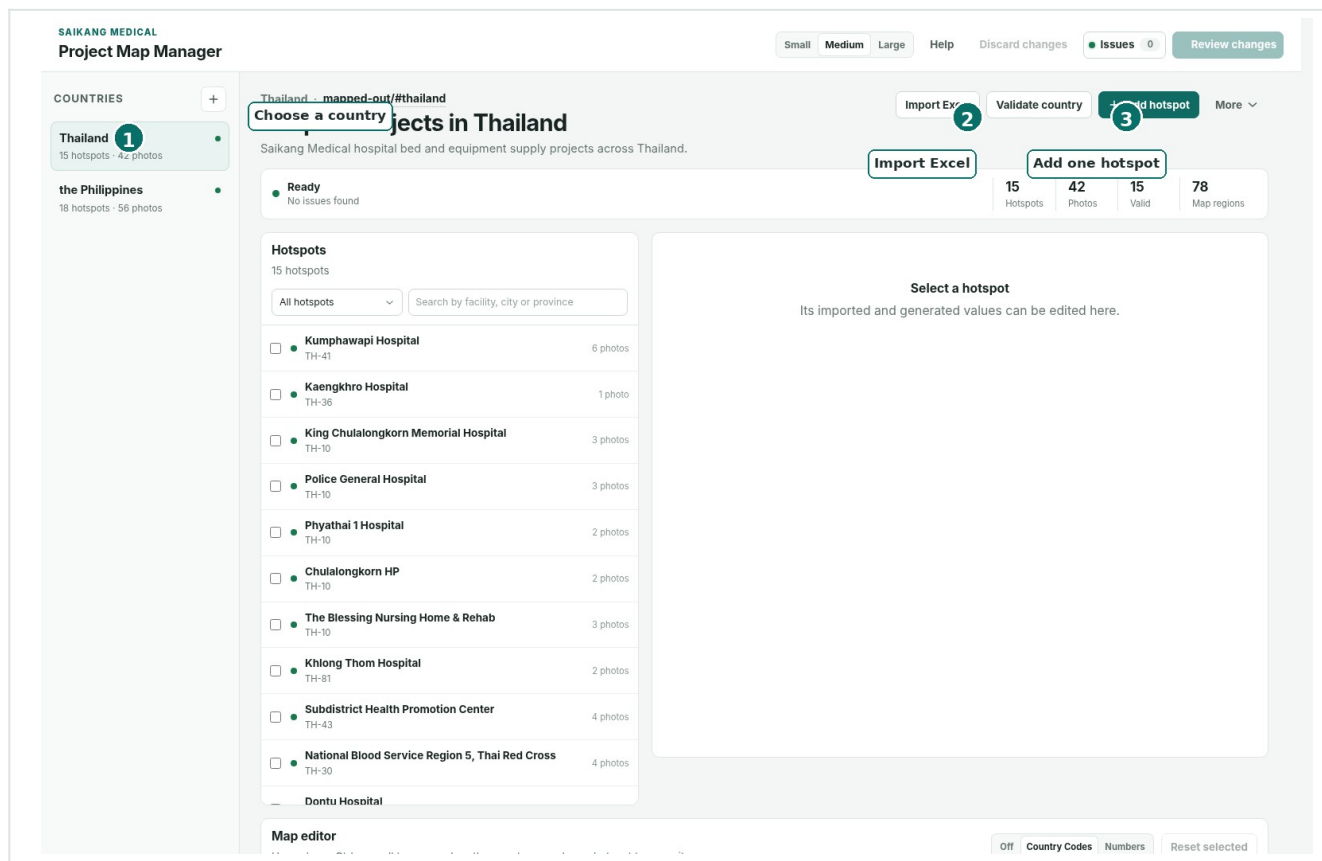

Important

Nothing is committed or pushed to GitHub automatically. The repository is only changed when you choose Apply changes; Git commit is still the final step to publish for the public.

1 Choose where you are working

Start with the country. Then choose the fastest way to make your update.

Before step 1: run launcher.bat on Windows or launcher.command on macOS.

The three controls you will use most: country, Import Excel and Add hotspot.

1 Choose a country

Select it from the list on the left.

2 Use Import Excel for several changes

Best when you have multiple new or updated projects in the standard spreadsheet.

3 Use Add hotspot for one project

Best when you only need to enter a single project manually.

Less common jobs

Use More for map settings, replacing a country SVG, or finding unused images. You do not need these for most day-to-day edits.

2 Add or edit a project

A hotspot is one project/facility shown on the public map.

Hotspot details

Valid

Hospital / facility name *

Phayao Hospital

City / region

Year

Address

Case description

It's the main public hospital in Phayao Province, in northern Thailand. It serves as the prime healthcare center and plays an important role in both emergency care and general medical services for the local population. We won a 110 manual bed project here, with our model V3

Coordinates

Latitude *

19.159313

Longitude *

99.864874

Coordinates are valid for this map.

Province / state *

Phayao (TH-56)

Generated SVG

x 170 · y 90

Images

Added separately from Excel · files over 4 MB are flagged, but never changed automatically

Drop images here or use "Add images" above

6.png

images/thailand/phayao/6.png

745 KB

Used

3.jpeg

images/thailand/phayao/3.jpeg

50 KB

Used

Only four fields are required

- Facility name
- Latitude
- Longitude
- Province / state

Everything else is optional

City/region, year, address, case description and photos can be left blank if you do not have them.

Coordinates

Paste normal decimal coordinates. The manager also accepts directional values such as 15.0345° N.

If latitude and longitude look swapped, the manager warns you and may suggest a swap.

The SVG position is generated automatically - you do not type it.

Green = ready

A green Valid status means the required information is present and no review warning was found.

Check the photos

Photos are added separately from Excel. Decide which ones should appear on the public map.

The Images area: add files, reorder them, keep them Used or switch them to Unused.

Add photos

1

Drag files into Images

Or choose Add Images.

2

Check the Used switch

Used photos appear in the public carousel. Unused photos stay in the project but are hidden.

Size warnings

A photo above 4 MB gets a yellow warning. It can still be saved.

Images are never reduced automatically. Choose Reduce only when you want to optimise that specific file.

Unused is not deleted

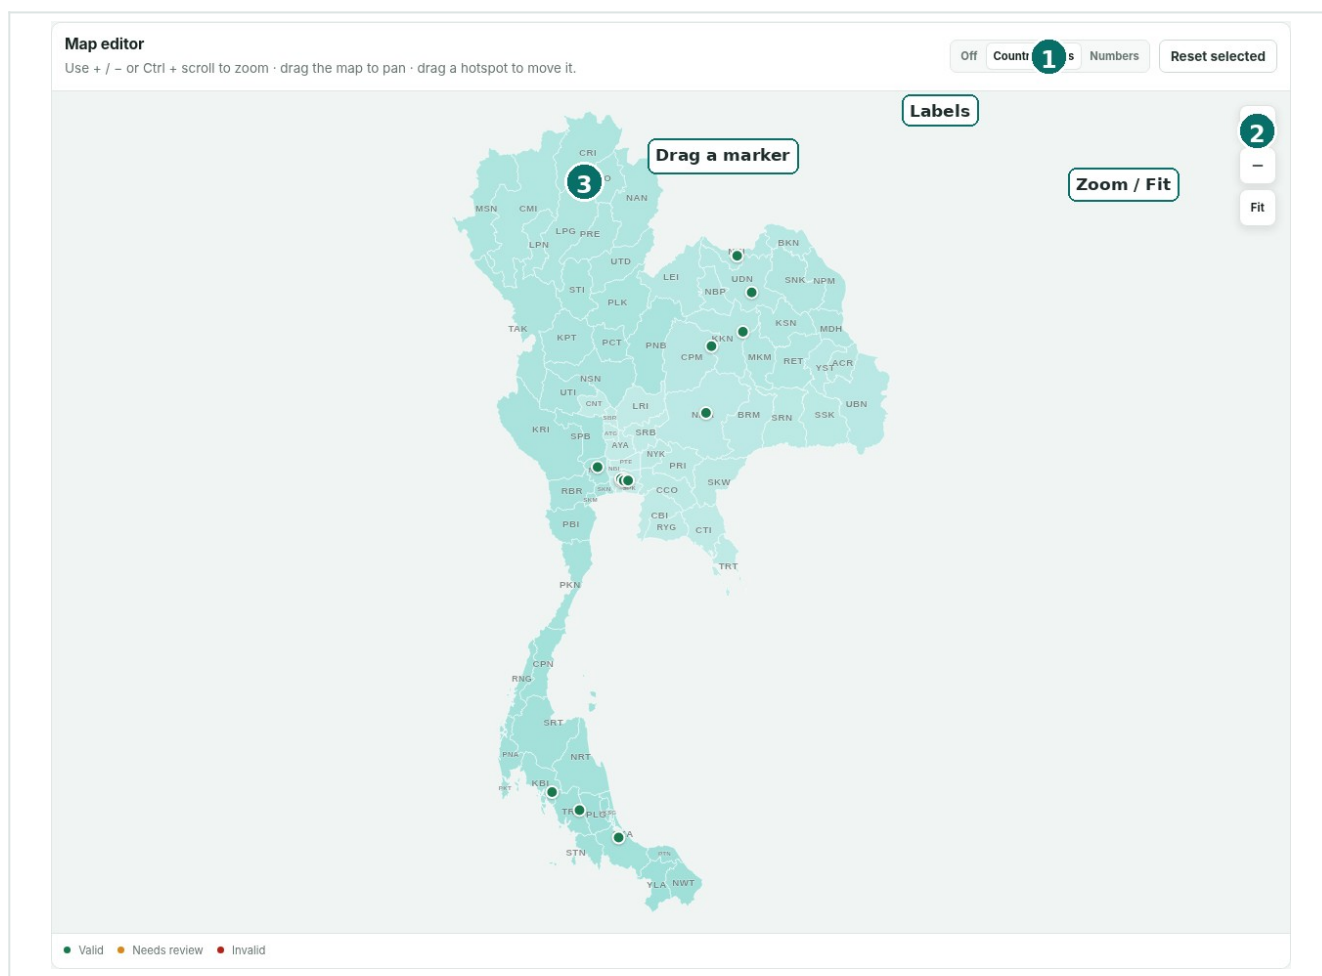

An Unused photo remains in the repository so you can turn it back on later.

Project Map Manager · User guide

4

Check the marker on the map

Move the marker only when the real project location is wrong.

Map editor controls and the selected project marker.

Move and zoom

- Drag the map background to pan.
- Use + / – to zoom, or hold Ctrl while scrolling over the map.
- Choose Fit to return to the full country.

Labels and province checks

- Country Codes shows a human-facing province/state abbreviation.
- Numbers shows the exact raw SVG region ID.

Yellow marker = mismatch

If you drag a marker outside its assigned province/state, the marker turns yellow and the Province/state field shows Mismatch. The manager does not silently change the province for you.

4 Check issues

Validation separates problems you must fix from things that simply deserve a second look.

GREEN Ready	YELLOW Review	RED Fix first

Mother of Mercy Hospital: Coordinates fall in Samar (PH-WSA); assigned to Leyte (PH-LEY).

Dr. Arturo R Pingoy Medical Center: Coordinates fall in Sultan Kudarat (PH-SUK); assigned to South Cotabato (PH-SCO).

Close

Use the filters to focus on Blocking or Review items.

Validate country

Use this while working on the current country. Fix red items, then review yellow ones.

Typical yellow items

A photo over 4 MB, a province mismatch, a possible duplicate or uncertain coordinates. Yellow does not block saving; red does.

Issues

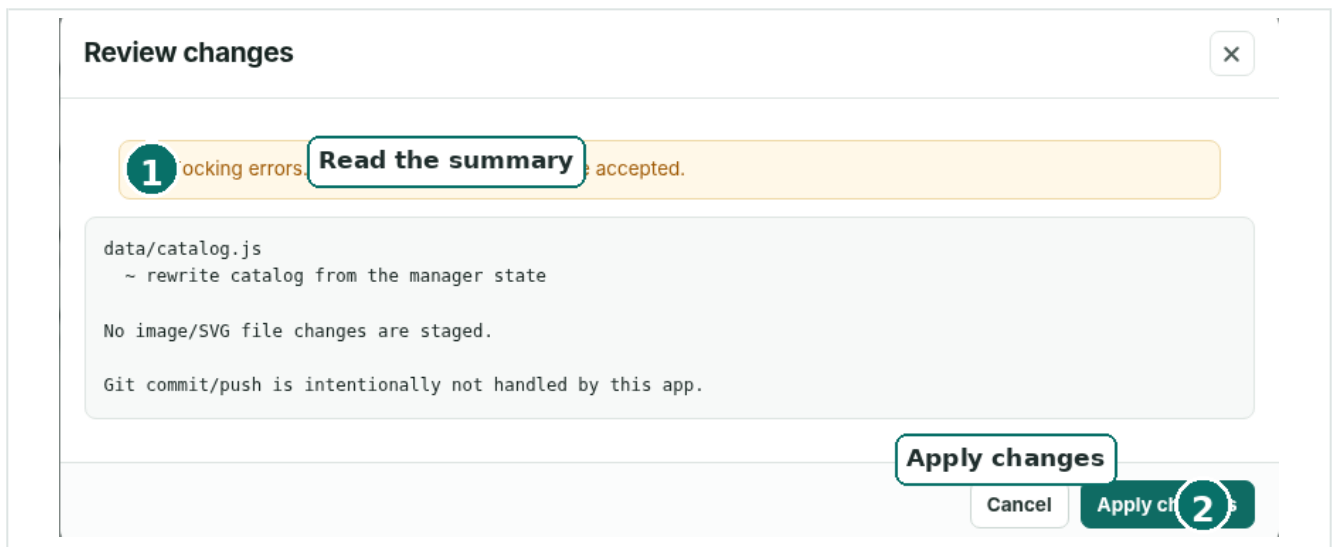

Use this for the project-wide view. Click an issue to open the correct country or hotspot and highlight the affected area when possible.

Project Map Manager · User guide

6

5 Review, then apply

This is the only step that writes your staged manager changes into the local repository.

Read the summary first. Apply changes only when the result looks right.

Before Apply changes

- Read the file summary.
- Fix every red issue.
- Review yellow warnings and decide whether they are acceptable.

If you change your mind

Use Discard changes to reload the current repository files and remove staged temporary files.

If you only moved a marker by mistake, use Reset selected. It restores the map position without undoing text or photo edits.

Still local

Apply changes writes files on your computer. It does not commit or push to GitHub.

What should you commit?

Use Git status/diff after every Apply changes. The list below covers the normal cases.

Always commit this

data/catalog.js is rewritten every time Apply changes succeeds. If you do not commit it, hotspot/content edits will not reach the website.

Always

data/catalog.js

Country entries, hotspot details, coordinates, province/state assignments, image paths and saved map settings.

When photos changed

images/<country-slug>/...

Commit new, changed or deleted hotspot image files together with data/catalog.js.

New / replaced map

images/<country-slug>/<country-slug>.svg

Commit the country SVG when you create a country or replace its map. Existing SVGs are not rewritten for normal hotspot edits.

Only if you edited mappings

manager/region-metadata.js

Commit this only when you intentionally change human-facing Country Code mappings.

A useful rule

If **data/catalog.js** points to an image or SVG, that file must exist in the committed repository too.

Unexpected files?

Normal country/hotspot editing should not require changes to index.html, data/main.js, manager application files, or launcher/server files. If they appear, review the diff before committing.

Import an Excel update

Use Import Excel when the spreadsheet is the quickest source for several projects.

Thailand · [mapped-out/#thailand](#)

Import Excel

Validate country

+ Add hotspot

More ▾

Hospital Projects in Thailand

Saikang Medical hospital bed and equipment supply projects across Thailand.

Select the correct country first, then choose Import Excel.

Expected columns

Country · City · Hospital Name · Year · Address · Case
Description · Latitude · Longitude · Image

The Image column is only a cutoff marker. The manager ignores that column and everything to its right; photos are added separately.

What the import shows

- New - a new hotspot
- Update - an existing hotspot will change
- Unchanged - nothing to do
- Conflict - review before continuing

Good to know

Existing photos are kept when a hotspot is updated. Blank rows are allowed; import stops only after five consecutive empty rows. Import results are still staged until Apply changes.

Add a country or replace its SVG

These jobs are less frequent, so keep them separate from the everyday hotspot workflow.

Add country

Country name * Name + slug 1

e.g. Portugal

Country slug *

e.g. portugal

Lowercase letters and hyphens only. Used in the URL and `images/<slug>/`.

Public map title

Defaults to Hospital Projects in [Country]

Landing page description Choose the SVG 2

Logo path

images/logo-02.png

Logo alt text

Country SVG *

Cancel Save

Add a new country

- 1 Choose + beside Countries**
Enter the country name and slug.
- 2 Choose the country SVG**
The manager reads the map bounds, size and province/state IDs automatically.
- 3 Add hotspots now or later**
A country can be created with only its SVG and populated later.

Replace an existing map

Open More → Replace country SVG, then run Validate country. Existing markers are regenerated from their saved latitude/longitude and checked against the new regions.

SVG region IDs must be unique

Duplicate region IDs are a red/blocking map issue because the manager cannot reliably match hotspots when two shapes share the same ID.

Country Codes

The manager prefers a data-code, data-abbr or data-label on each SVG region. Alphabetic suffixes such as PH-NEC can be used automatically. If the SVG only has numeric/raw IDs, add the human-facing mapping in `manager/region-metadata.js`.
